All the parts that come into contact with the medium are structural ceramic materials, their chemical stability and hardness are extremely high (rockwell hardness HRC 90), second only to diamond, therefore, the valve has extremely high wear resistance, corrosion resistance, erosion resistance, good heat insulation performance and small thermal expansion.

The high-performance wear-resistant ceramic ball body is manufactured by adopting advanced grinding equipment and processes, and the grinding of valve balls and valve seats has completely changed the shortcomings of metal hard seal ball valves, such as easy leakage, large torque, and corrosion resistance of sealing surfaces, etc.

This valve is durable, highly reliable and has a long service life, which is 2 - 4 times that of titanium alloy valve and monel valve.

SSZ ceramic valves have incomparable absolute advantages in granular and corrosive media. they are widely used in petrochemical industry, flue gas desulfurization and deslagging systems in power plants, saline water in alkali plants, distillation processes, pulp control systems in paper mills, etc.
