- 1. The mature A/O biochemical treatment process has good removal of organic matter and nitrogen in sewage to meet the discharge requirements.
- 2. It has the ability to withstand impact load to adapt to the change of water quality and quantity.

- 3. The pre-aeration in the regulating pond can not only prevent the concentration of organic matter in the sewage, but also prevent the precipitation of suspended impurities in the regulating pond sewage, so as not to decay and stink, which greatly enlarges the surrounding area.
- 4. Sludge pre-reflux nitration process was adopted to increase sludge production.
- 5. Using new fillers, the film hanging is fast, the life is long and the treatment is fast.
- 6. Fully consider the possibility of secondary pollution and its impact to the extent.
- 7. It is easy, reliable and reliable to use centralized control and automatic operation.
- 8. The treatment facilities are all set below the ground surface, without surface area, which can be used for greening and anti-freezing (except for the fan control room).
