## 产品详情

Bayhydrol A 2646

Solubility / thinnability    The product is soluble in water.

Properties / Applications    On account of its outstanding mechanical and

The high reactivity enables short drying times, which contribute to enhanced productivity. The viscosity of the product is largely governed by

the pH. As the pH may decrease during storage, a decrease in viscosity is also to be expected. The viscosity can be restored to its original value by

the addition of small amounts of triethanol amine. Dowanol PnB and triethanolamine are OH-functional

cosolvents/amines that react with isocyanates. They

are therefore reactive thinners and not VOC-relevant pursuant to the Decopaint Directive 2004-42-EC. The binder can also be used for the formulation of high-grade low VOC coatings for use on substrates such as wood, metal, plastic, etc. chemical resistance, the product is particularly suitable for the formulation of hard, high-gloss sealers for mineral substrates and reactive resins (EP, PUR). Furthermore, excellent accentuation of the grain of the substrate (e.g. colored coatings) is achieved. The product can also be combined with other water-reducible binders. On account of the many potential &nbsp; co-reactants, compatibility testing should always be carried out.
